Outline

Beyond ImageNet

1. Fully Convolutional Networks (FCNs)
2. Segmentation
3. **Transfer learning and Domain adaptation**

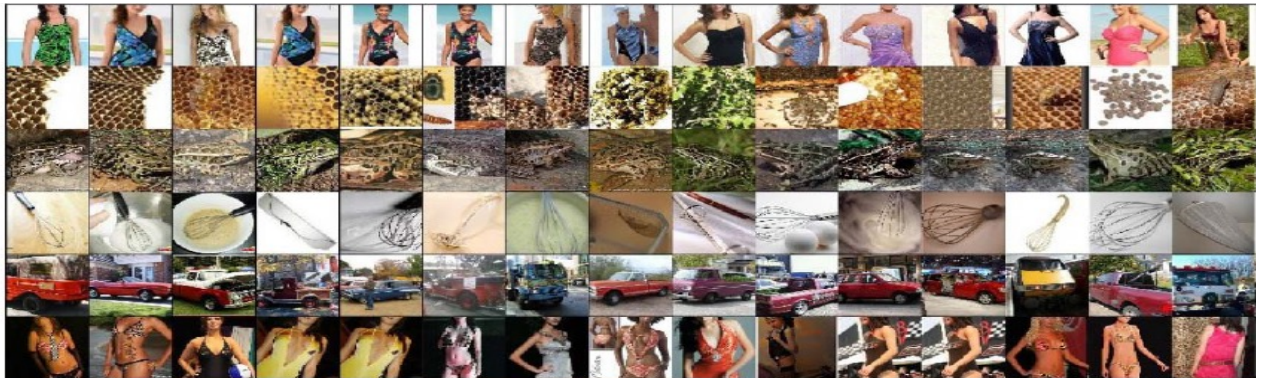
Transfer from ImageNet (source)

Transfer as **generic features**

Brut Deep features (learned from ImageNet)

(== a learned embedding from Image to vector representation)

Retrieval



Transfer learning (from source to target)

Frozen features + SVM => solution to small datasets

Frozen features + Deep

Fine tuning not easy in that case (small datasets)

Transfer from source(=ImageNet task) to target task

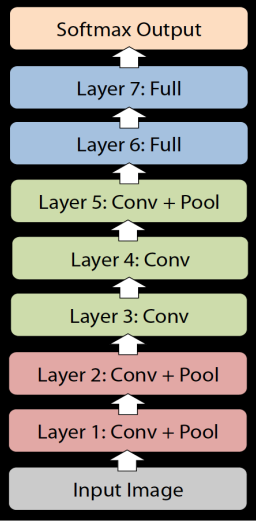
Source: ImageNet (dataset + 100 classes) => AlexNet trained

Target: new dataset Cal-101 and new classification task with 101 classes =>Chopped

AlexNet (layer i) + SVM trained on

Architecture of Krizhevsky et al.

- 8 layers total
- Trained on Imagenet dataset [Deng et al. CVPR'09]
- 18.2% top-5 error
- Our reimplementation: 18.1% top-5 error



Tapping off Features at each Layer

Plug features from each layer into linear SVM or soft-max

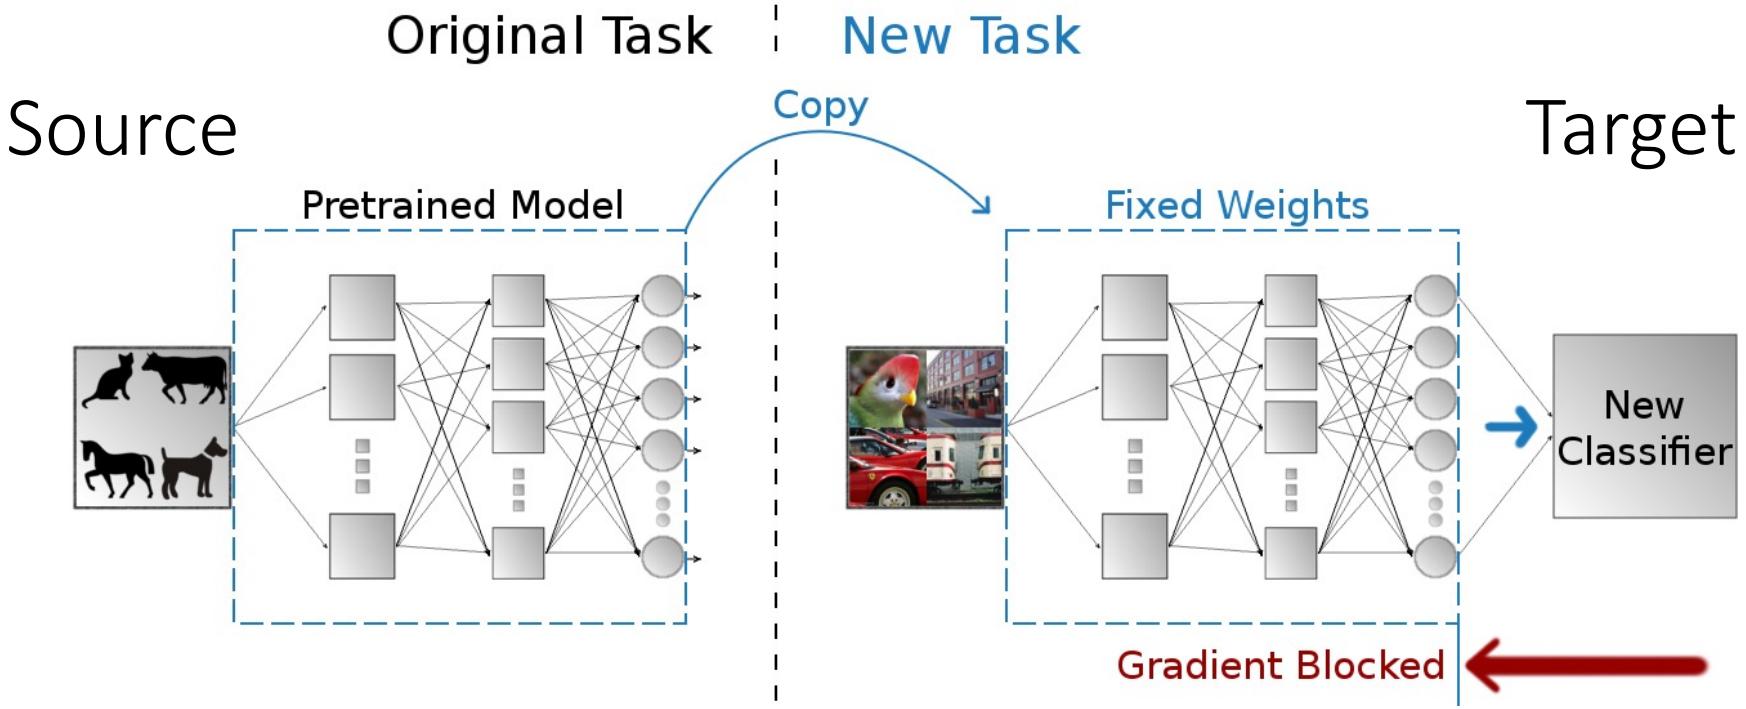
	Cal-101 (30/class)	Cal-256 (60/class)
SVM (1)	44.8 ± 0.7	24.6 ± 0.4
SVM (2)	66.2 ± 0.5	39.6 ± 0.3
SVM (3)	72.3 ± 0.4	46.0 ± 0.3
SVM (4)	76.6 ± 0.4	51.3 ± 0.1
SVM (5)	$\mathbf{86.2 \pm 0.8}$	65.6 ± 0.3
SVM (7)	$\mathbf{85.5 \pm 0.4}$	$\mathbf{71.7 \pm 0.2}$
Softmax (5)	82.9 ± 0.4	65.7 ± 0.5
Softmax (7)	$\mathbf{85.4 \pm 0.4}$	$\mathbf{72.6 \pm 0.1}$

=> Results better than SoA CV methods on Cal-101!

Transfer: fine-tuning of a deep model on target task

Train a deep (AlexNet) on source (ImageNet)
Keep the deep params. for target and complete with a small deep on top (fully trained on target task)
Fine-tune the whole model on target data

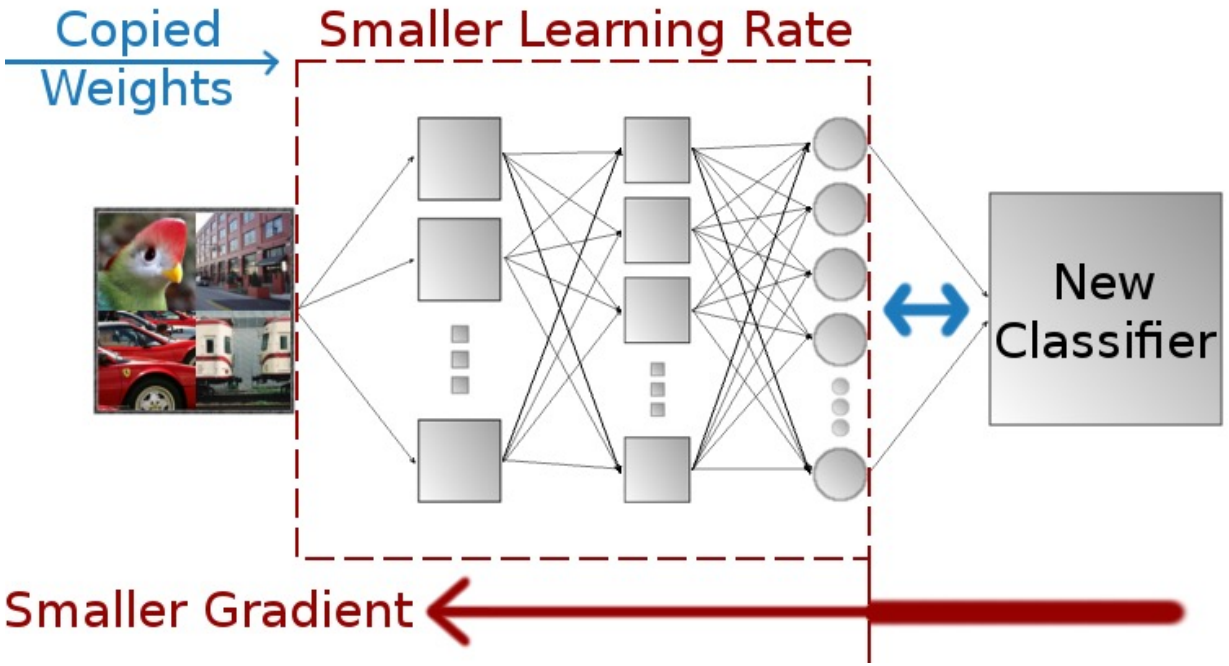
- Challenge: only limited target data, careful about overfitting
- Solution: Freeze the gradient's update for AlexNet part



Transfer: fine-tuning of a deep model on target task

Train a deep (AlexNet) on source (ImageNet)
Keep the deep params. for target and complete with a small deep on top (fully trained on target task)
Fine-tune the whole model on target data

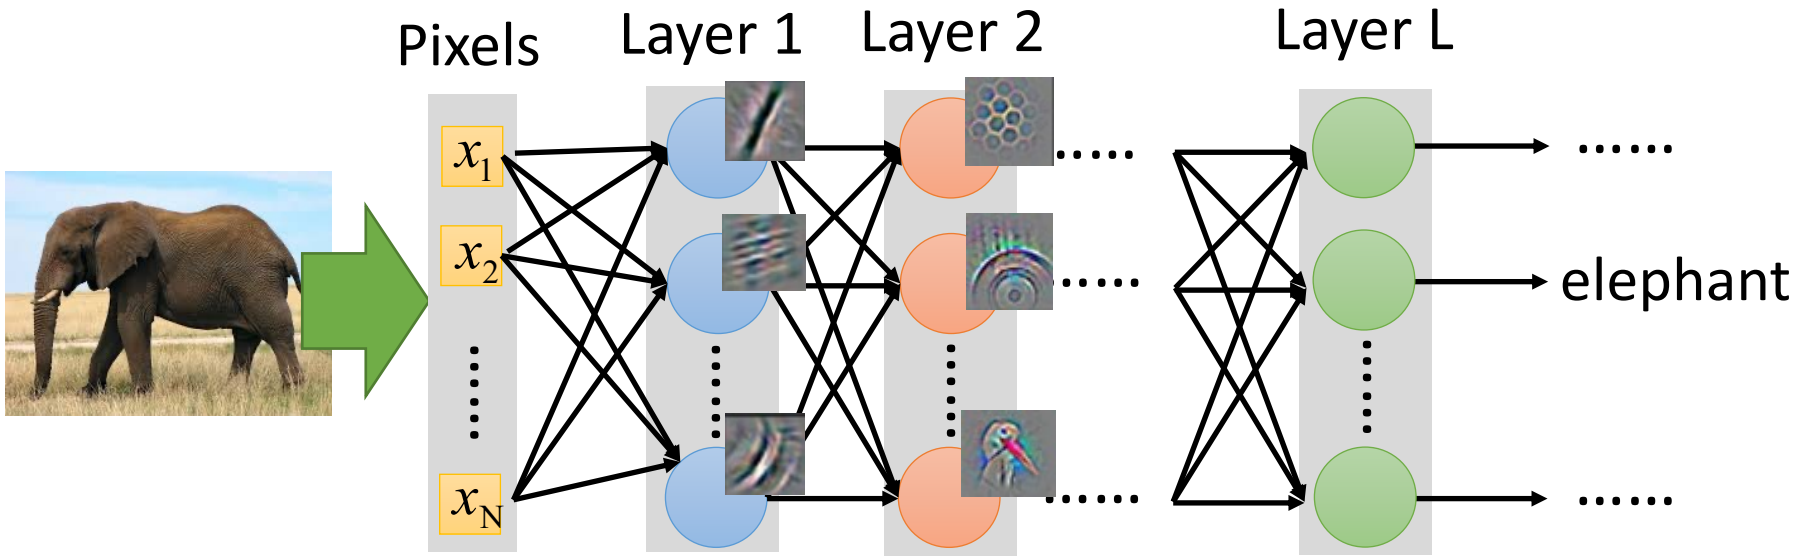
- Challenge: only limited target data, careful about overfitting
- Solution: Freeze the gradient's update for AlexNet part
- Other solution: use smaller gradient's update for AlexNet part



Transfer: which parts of the deep?

Which layer(s) can be transferred (copied)?

- Speech: usually copy the last few layers
- Image: usually copy the first few layers



Transfer: which supervision?

- Task description
  - Source data: (x^s, y^s) ⟸ A large amount
  - Target data: (x^t, y^t) ⟸ *(Very)* little

Rq: Few/One-shot learning: only a few/one examples in target domain

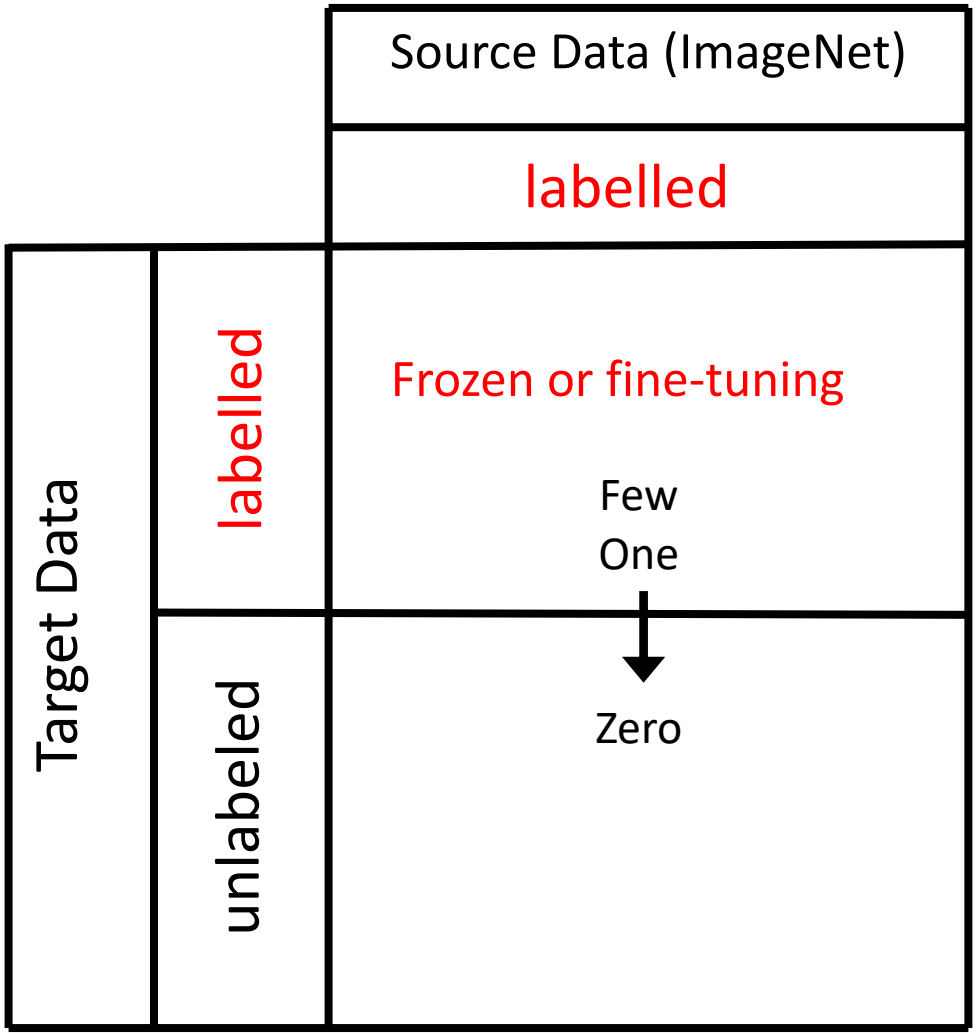
Many different contexts:

In vision: from large dataset (ImageNet) to small datasets (VOC2007)

In speech: (supervised) speaker adaption

- Source data: audio data and transcriptions from many speakers
- Target data: audio data and its transcriptions of specific user

More on transfer framework



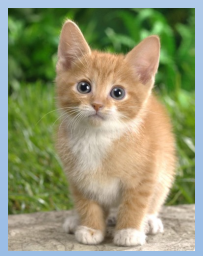
Main purposes:

Similar visual domain?

Same tasks (ie class)?

Similar domain: ImageNet task => Dog/Cat task

Target:
Dog/Cat
Classifier



cat

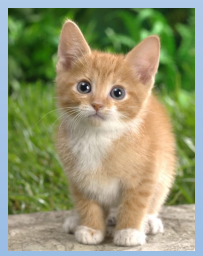
dog

Data ***not directly related to*** the task considered

ImageNet: Similar domain,
different task (1000 classes but NOT Dog and Cat classes)

General Framework for Transfer Learning

Target:
Dog/Cat
Classifier



cat

dog

Data ***not directly related to*** the task considered

elephant

tiger

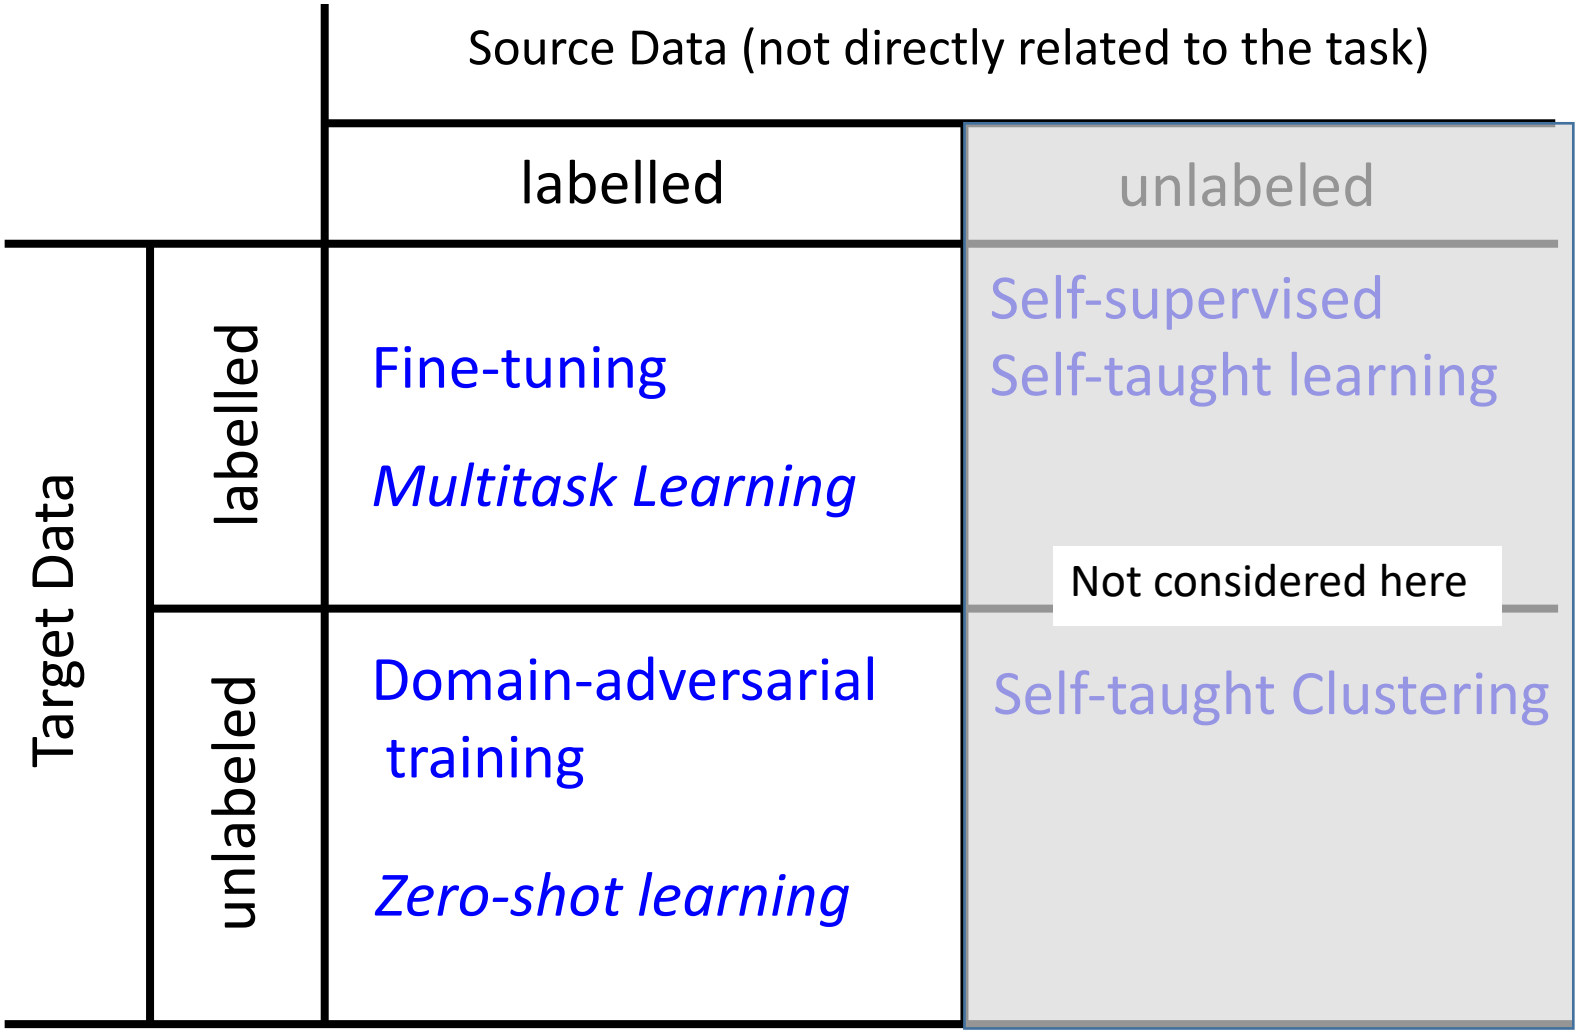
Similar domain, completely different tasks

dog

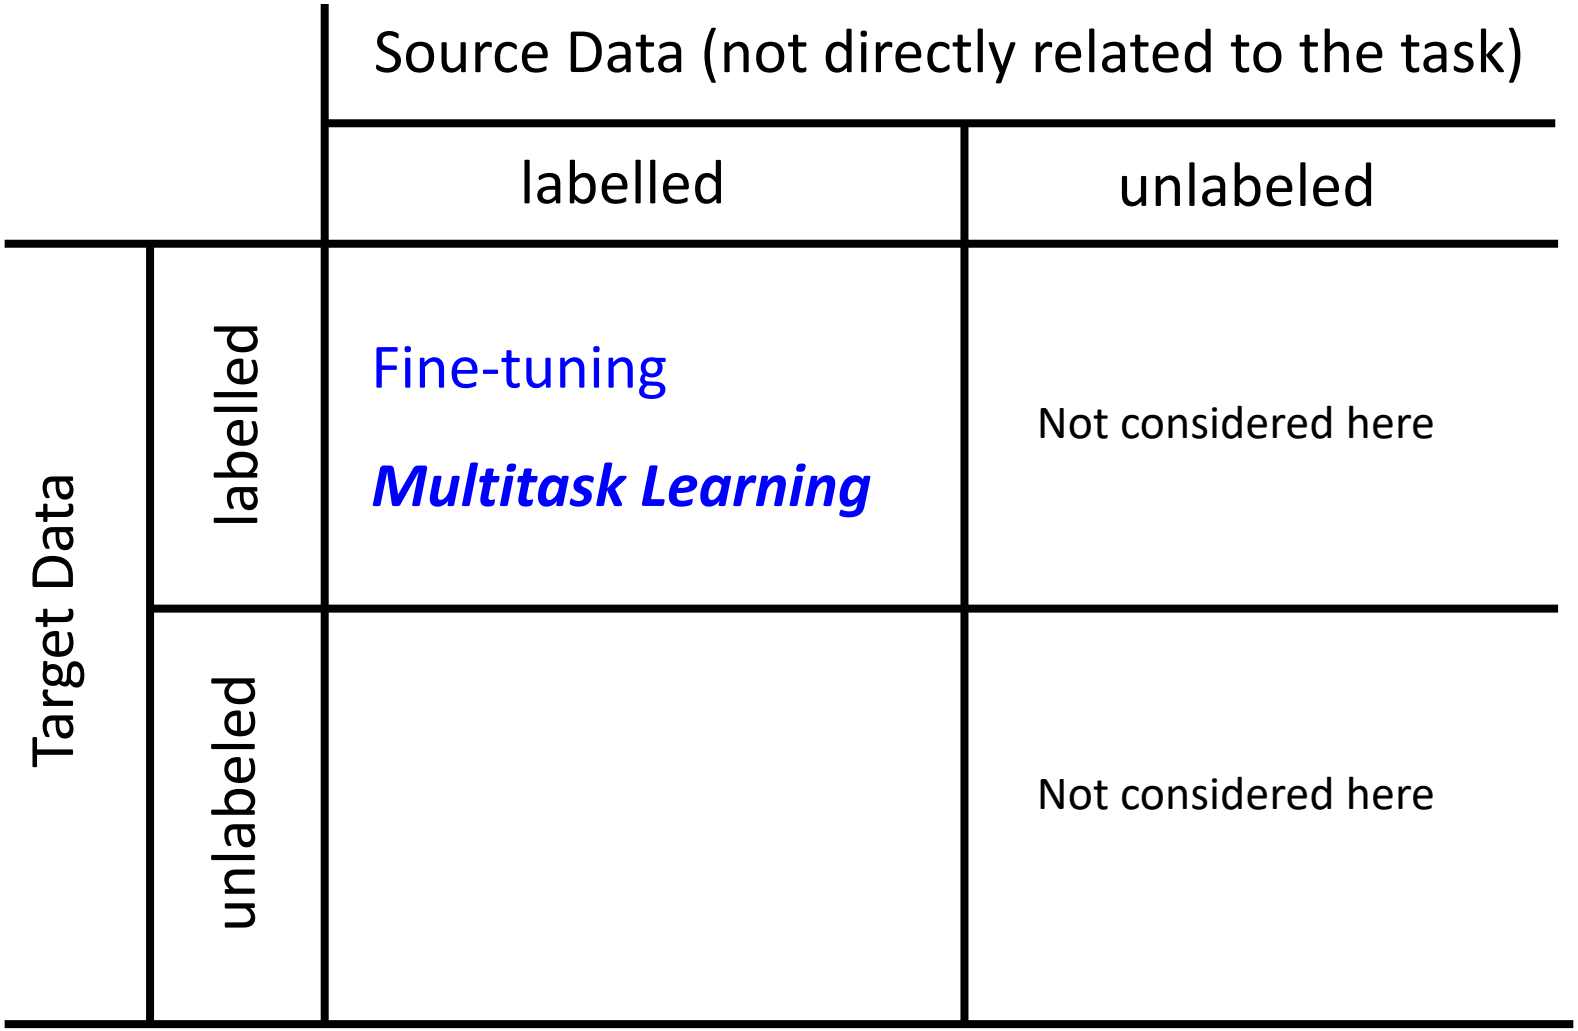
cat

Different domains, same task

General Framework for Transfer Learning

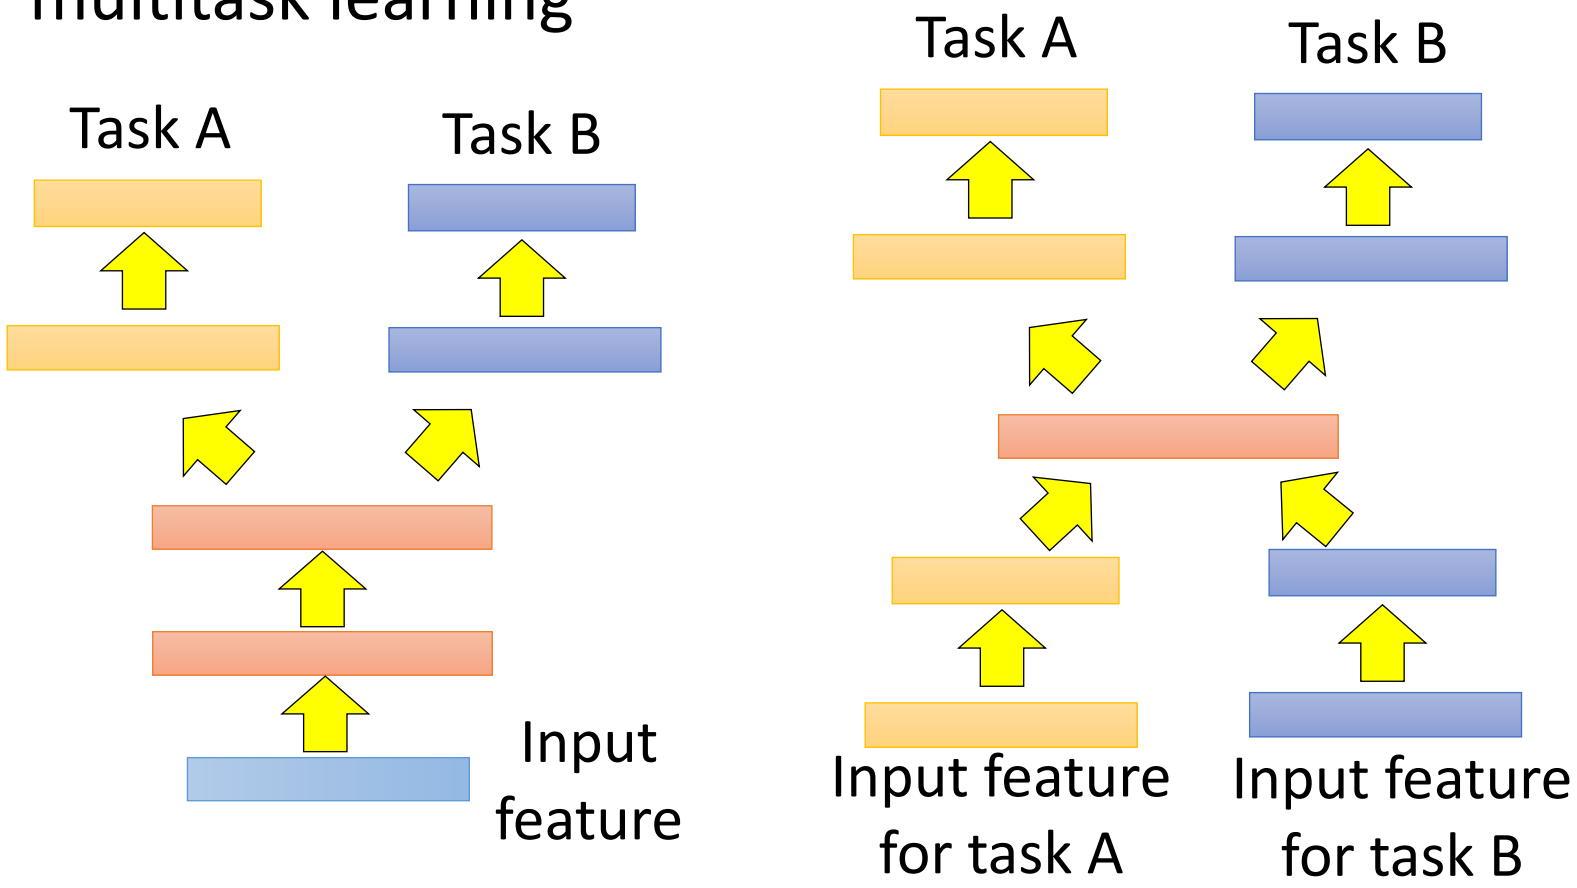


General Framework for Transfer Learning



Multitask Learning

- The multi-layer structure makes NN suitable for multitask learning



Transfer Learning - Overview

		Source Data (not directly related to the task)	
		labelled	unlabeled
Target Data	labelled	Fine-tuning *Multitask Learning*	Not considered here
	unlabeled	**Domain adaptation-adversarial training**	Not considered here

Unsupervised Domain Adaptation (UDA)

Source data: (x^s, y^s)

Target data: (x^t)

→ Training data

} Same task, domain mismatch

MNIST

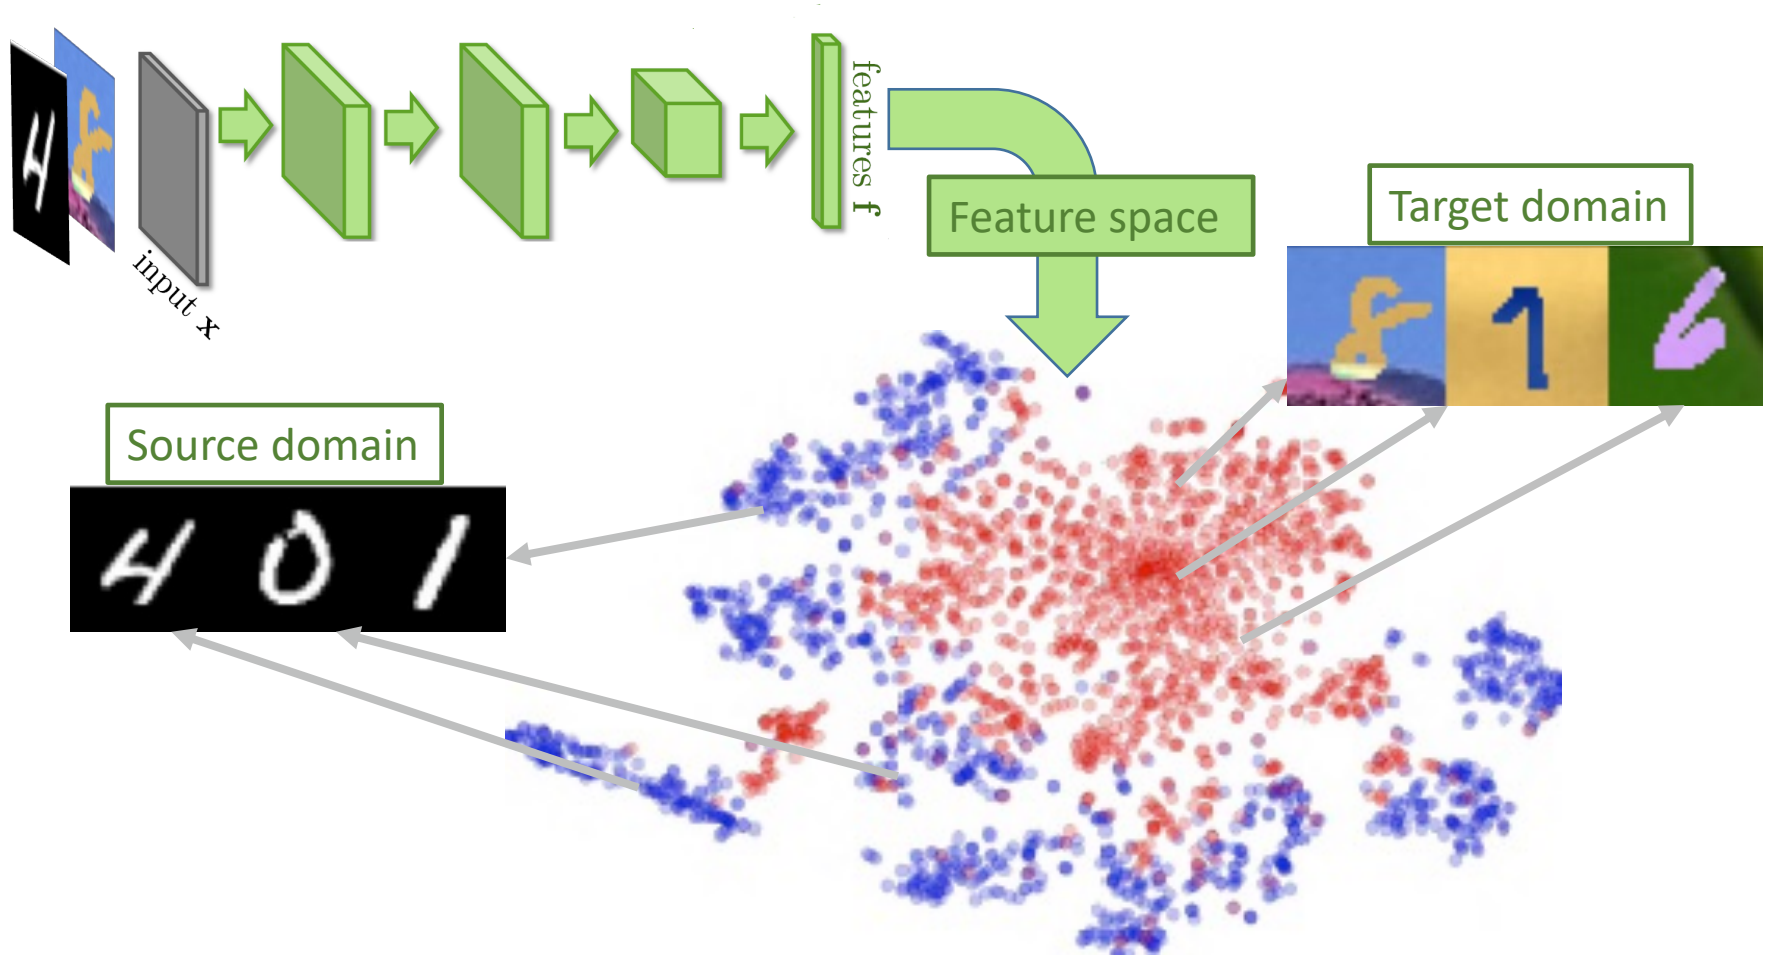
SOURCE — with labels

TARGET — without labels

MNIST-M

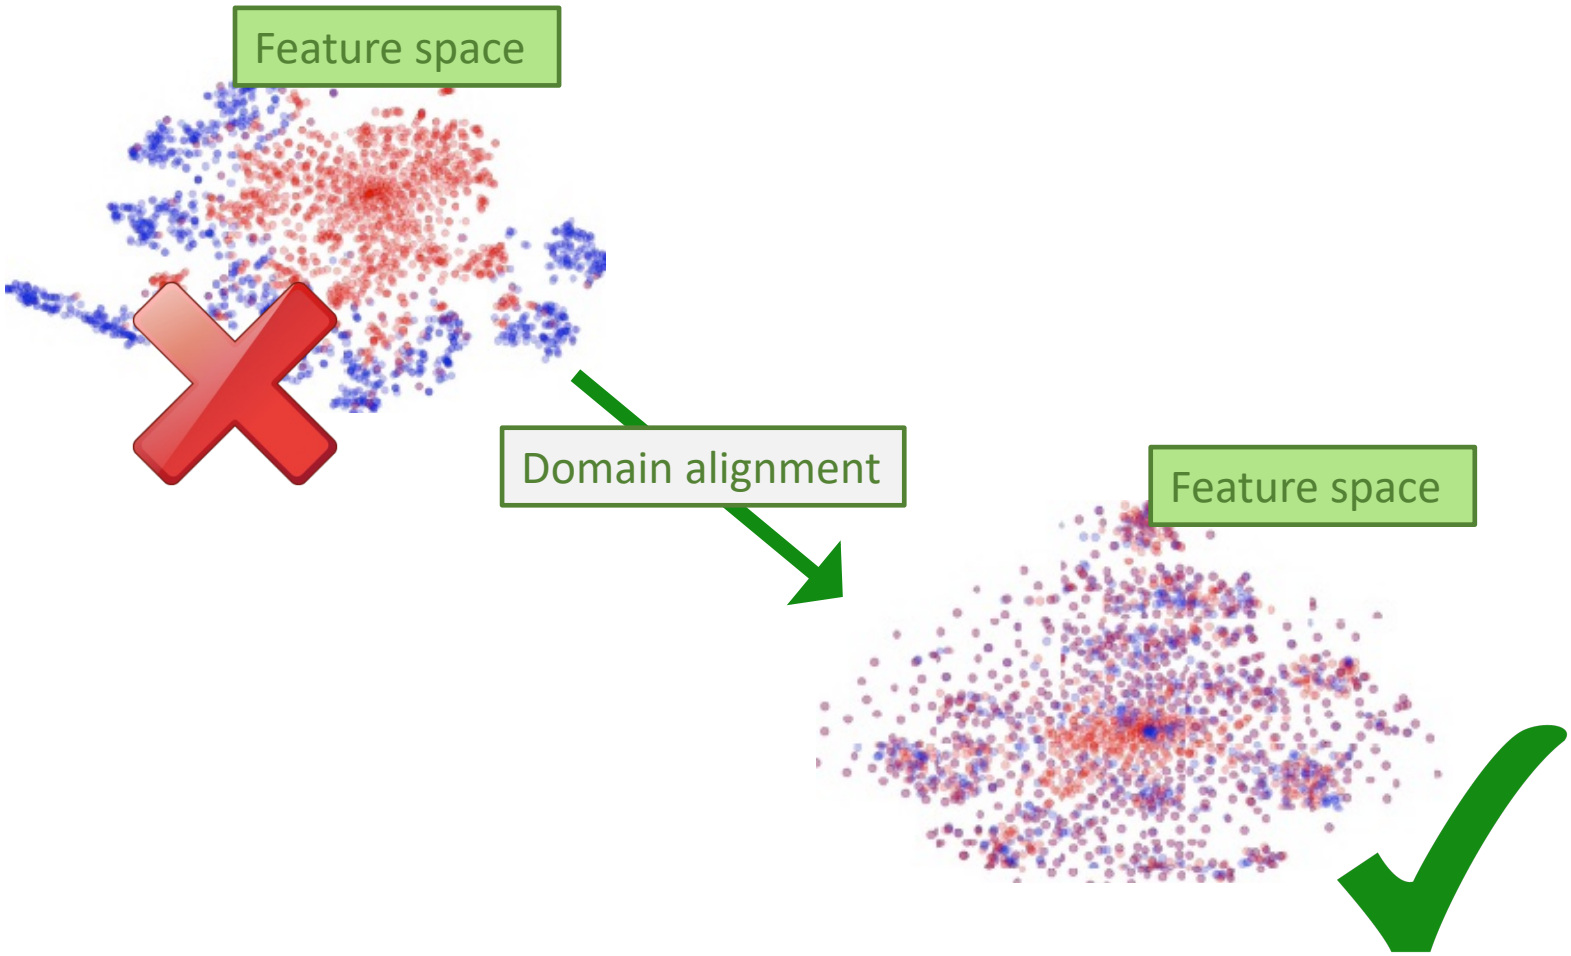
Final test on target domain!

Unsupervised Domain adaptation (UDA): objectives



Main principle: diminish the domain shift in the learned features, encourage domain confusion

UDA strategy: align both domains



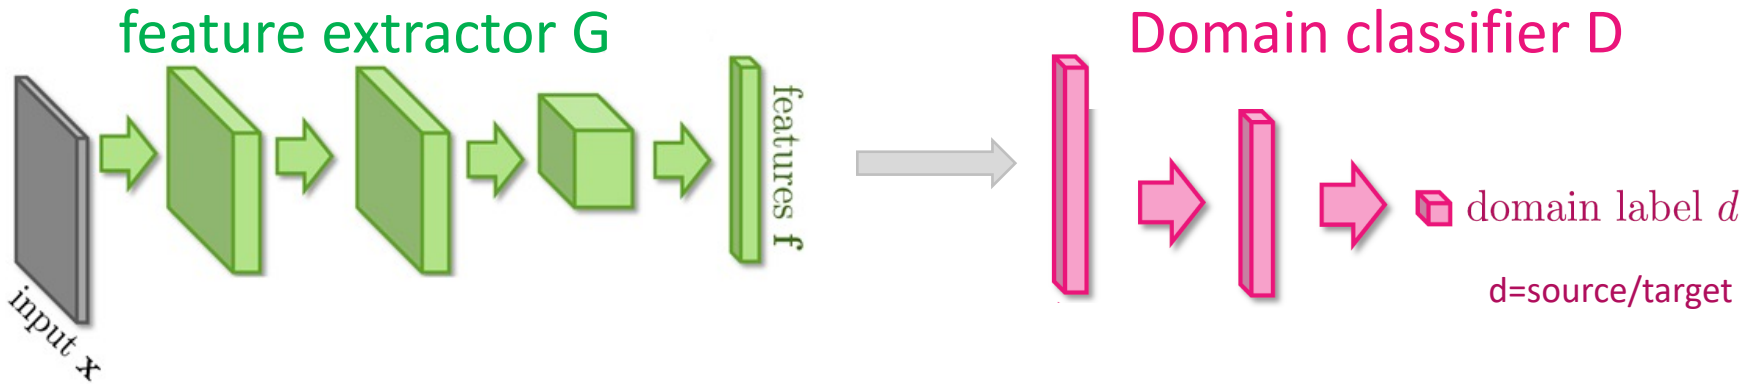
UDA strategy: 1/ domain-adversarial training

Add to the feature generator (G) a domain classifier (discriminant D) for which labels are available!

Learn Gand D:

G tries to align domains

D tries to identify domains

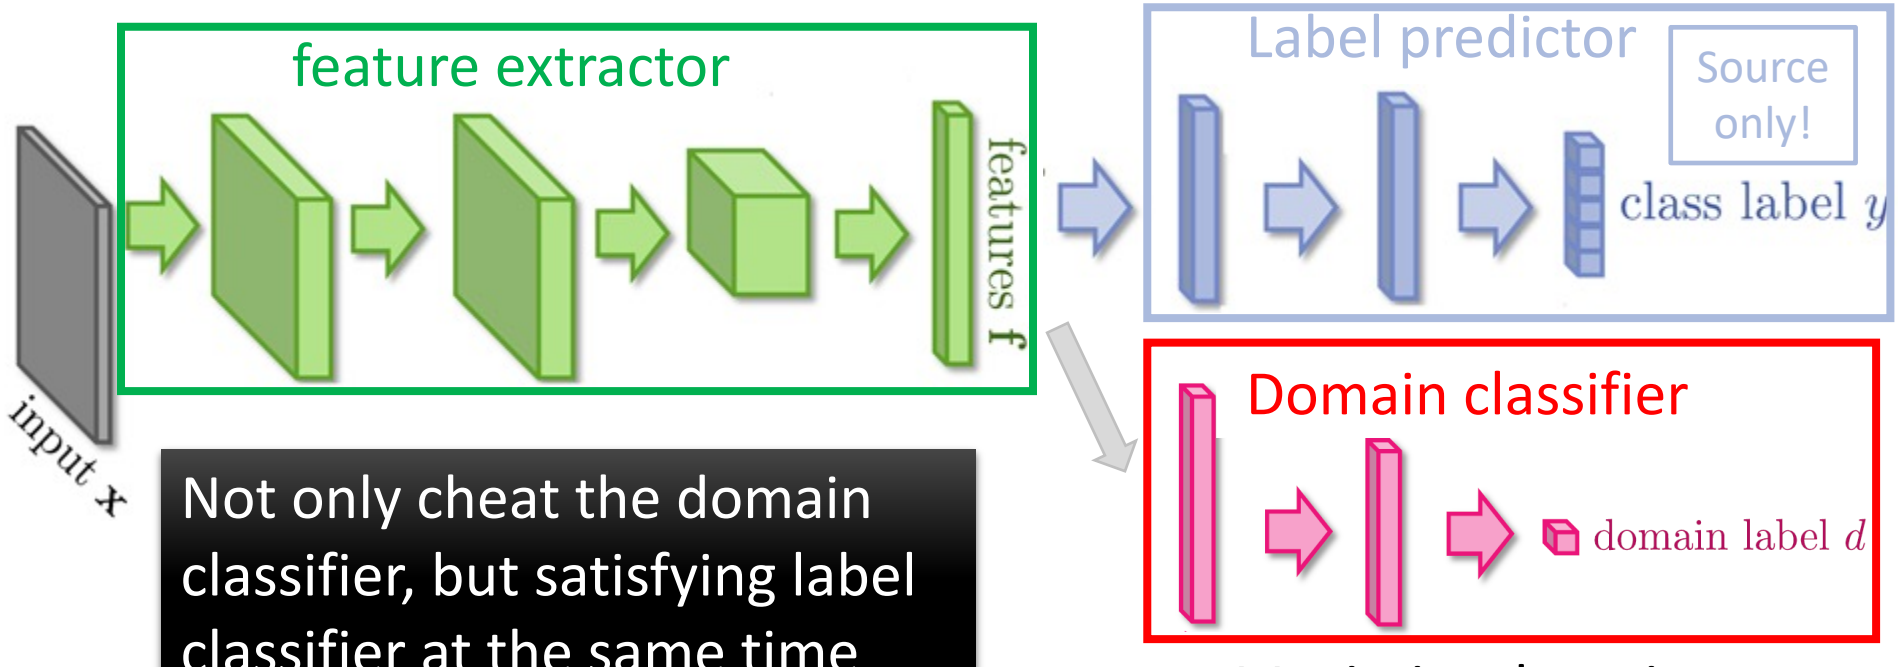


Rq: Similar to GAN (coming soon)

UDA strategy: 1/ domain-adversarial training
2/ classification task (same for source and target here)

Maximize label classification accuracy + minimize domain classification accuracy

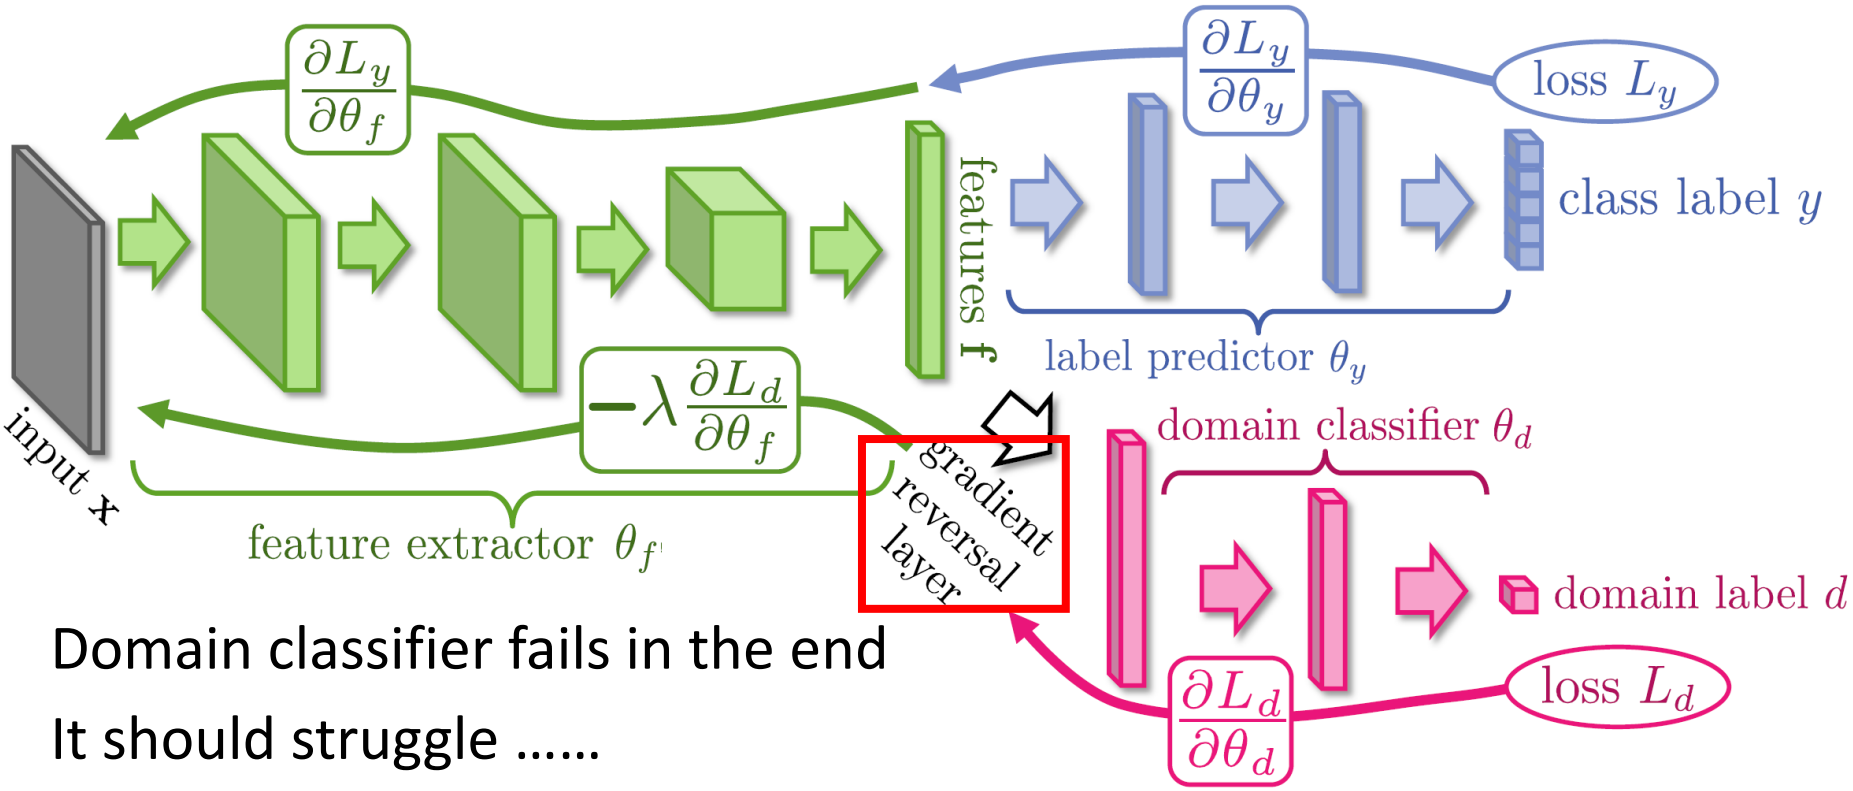
Maximize label classification accuracy



Not only cheat the domain classifier, but satisfying label classifier at the same time

Maximize domain classification accuracy

UDA strategy: joint learning



Domain classifier fails in the end

It should struggle ……

Yaroslav Ganin, Victor Lempitsky, Unsupervised Domain Adaptation by Backpropagation, ICML, 2015

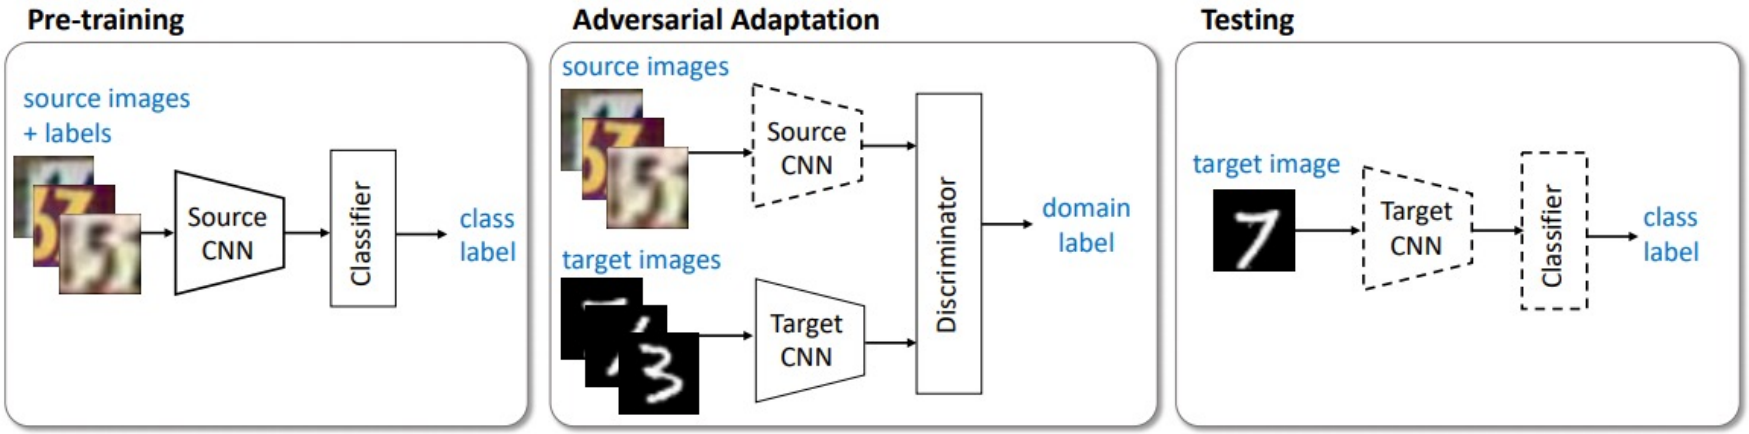
Domain adaptation

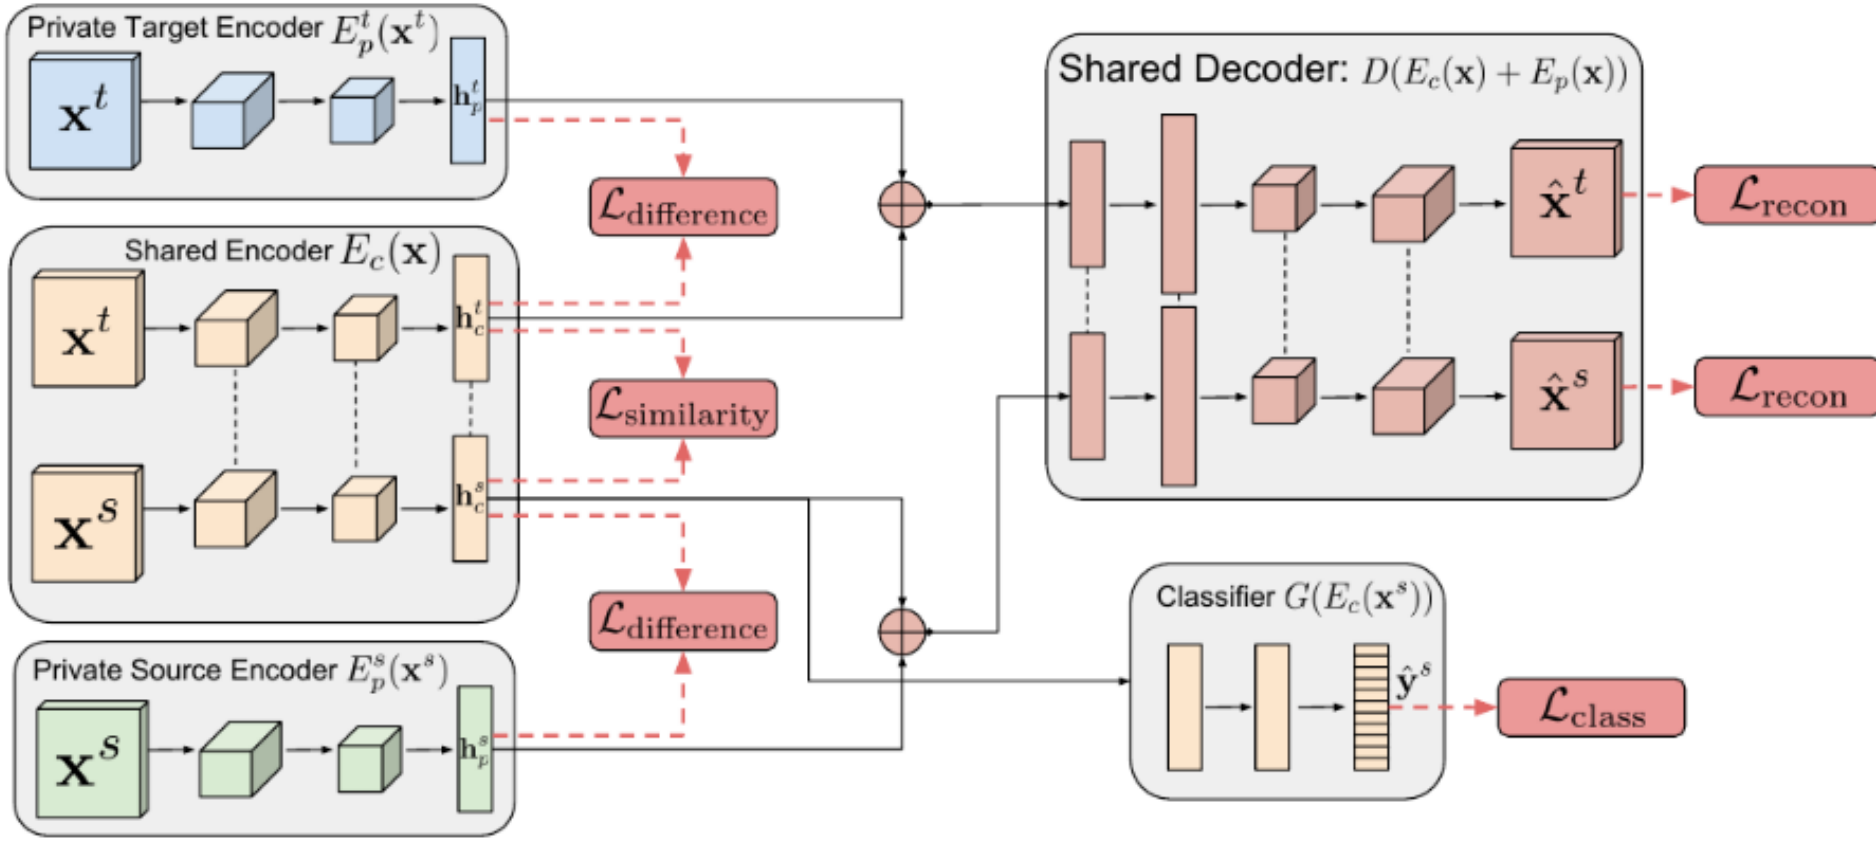
Main principle: diminish the domain shift in the learned features, encourage domain confusion

Another example: Adversarial Discriminative Domain Adaptation [Tzeng et al. 2017]



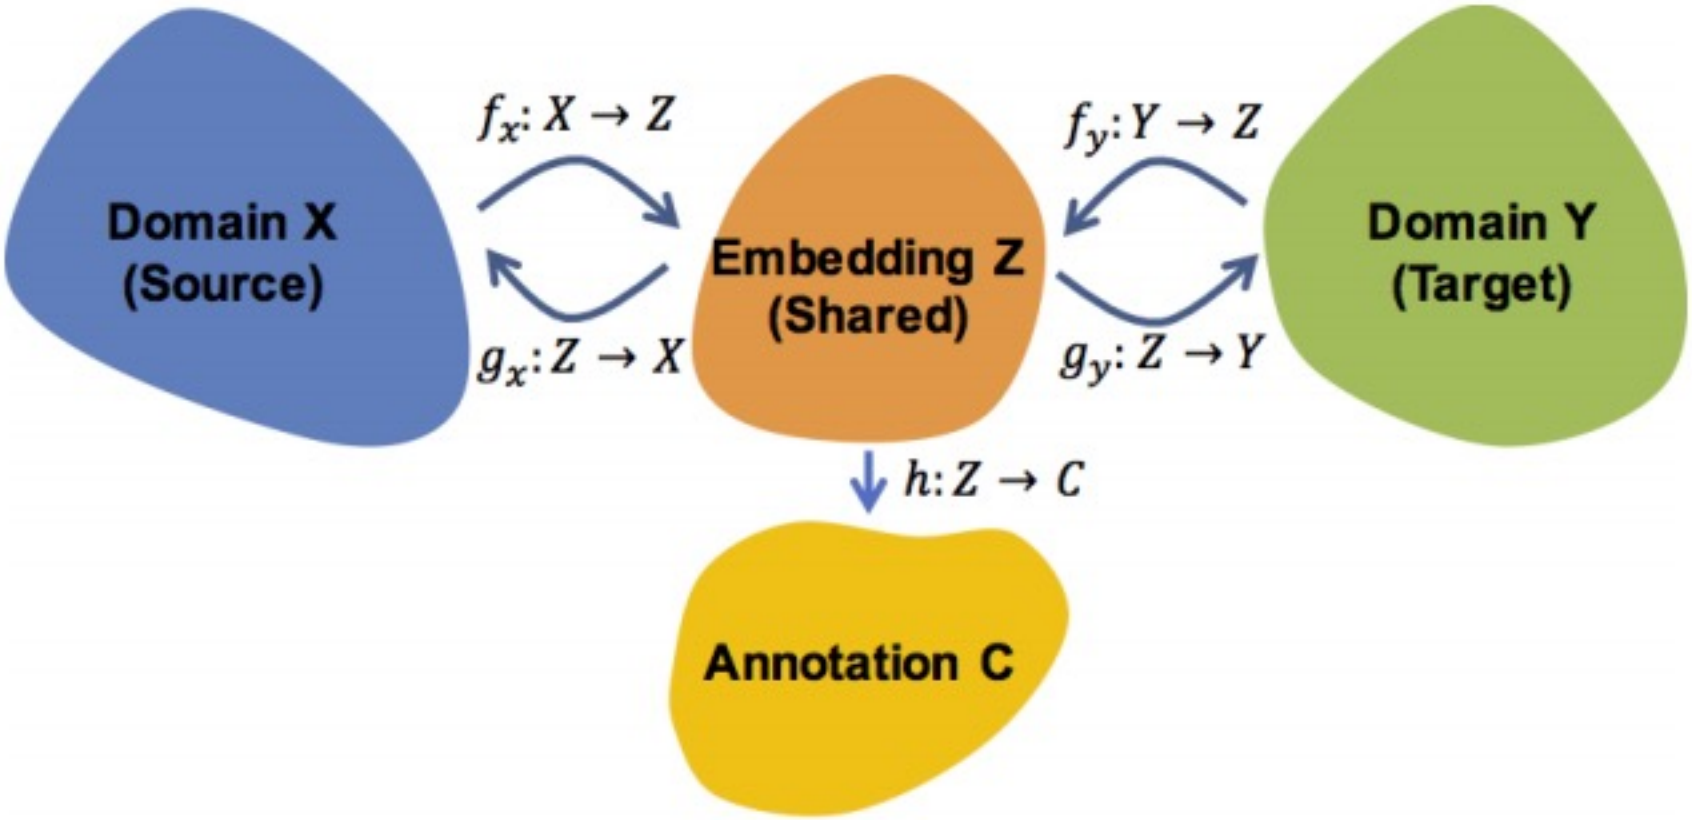
Domain adaptation

Other architecture



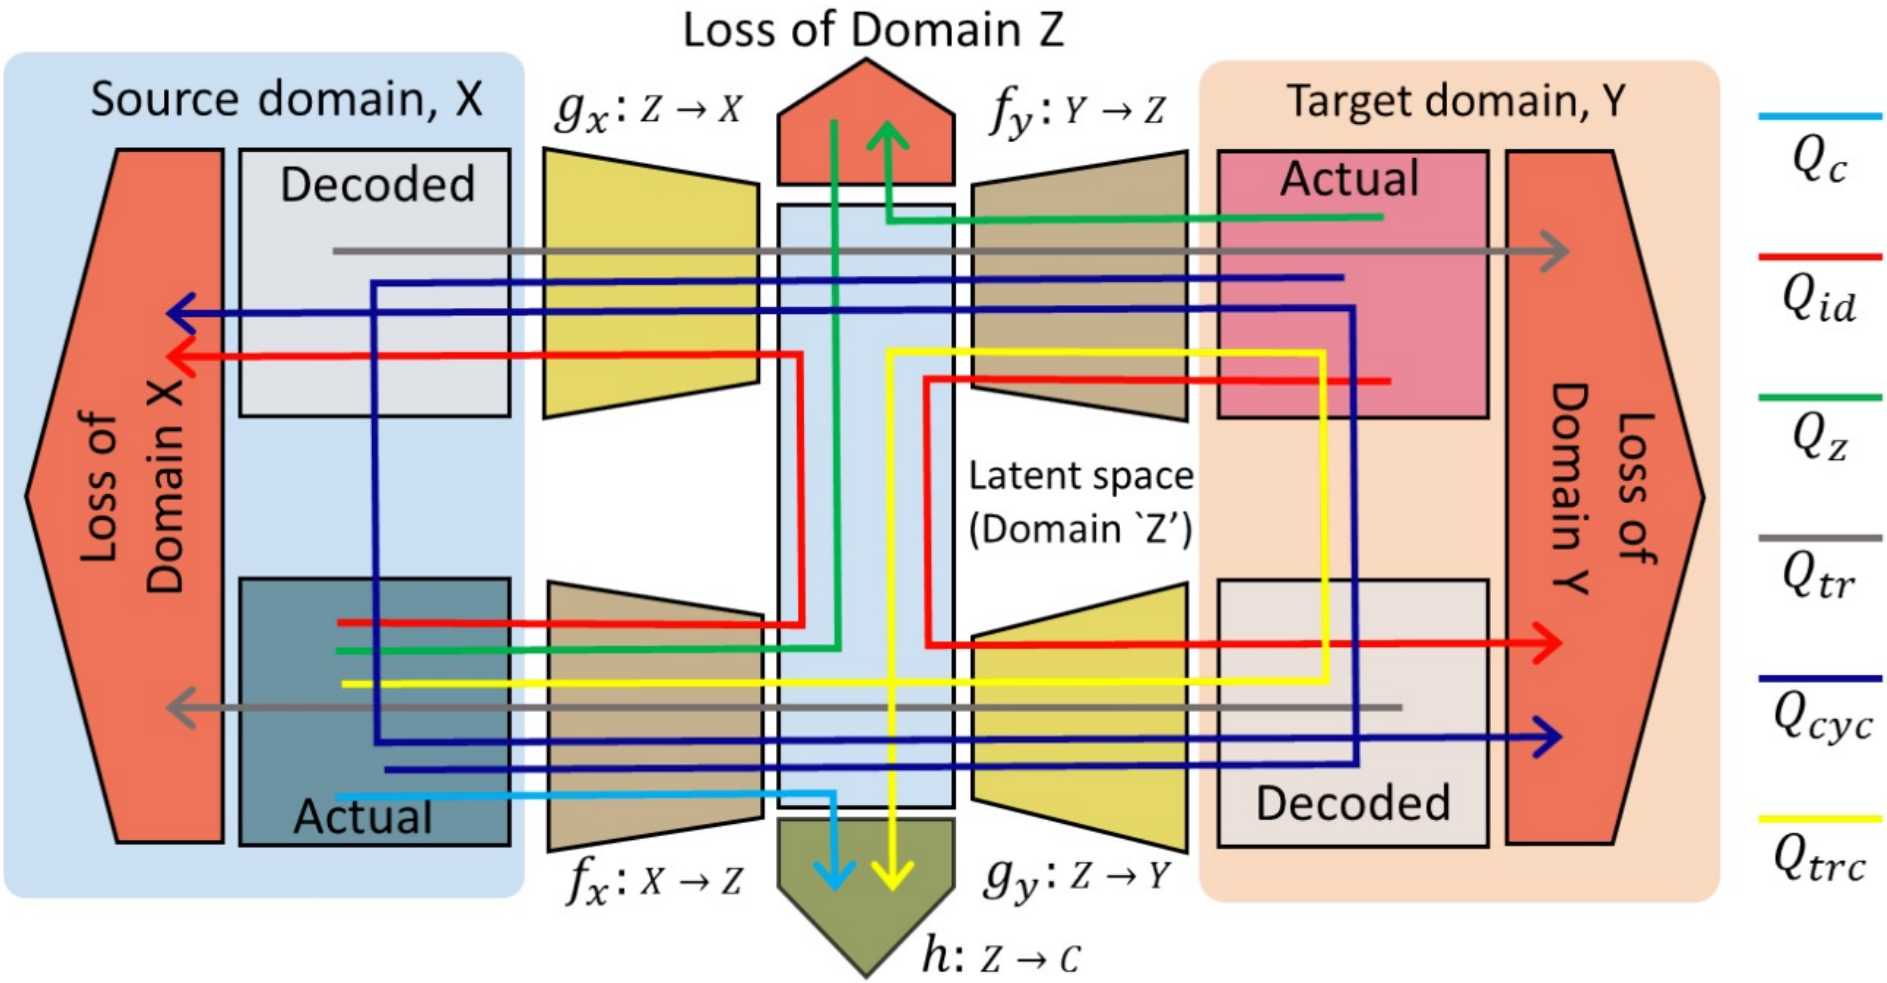
Domain adaptation

Other architecture: Image translation for Domain adaptation [Murez 2017]



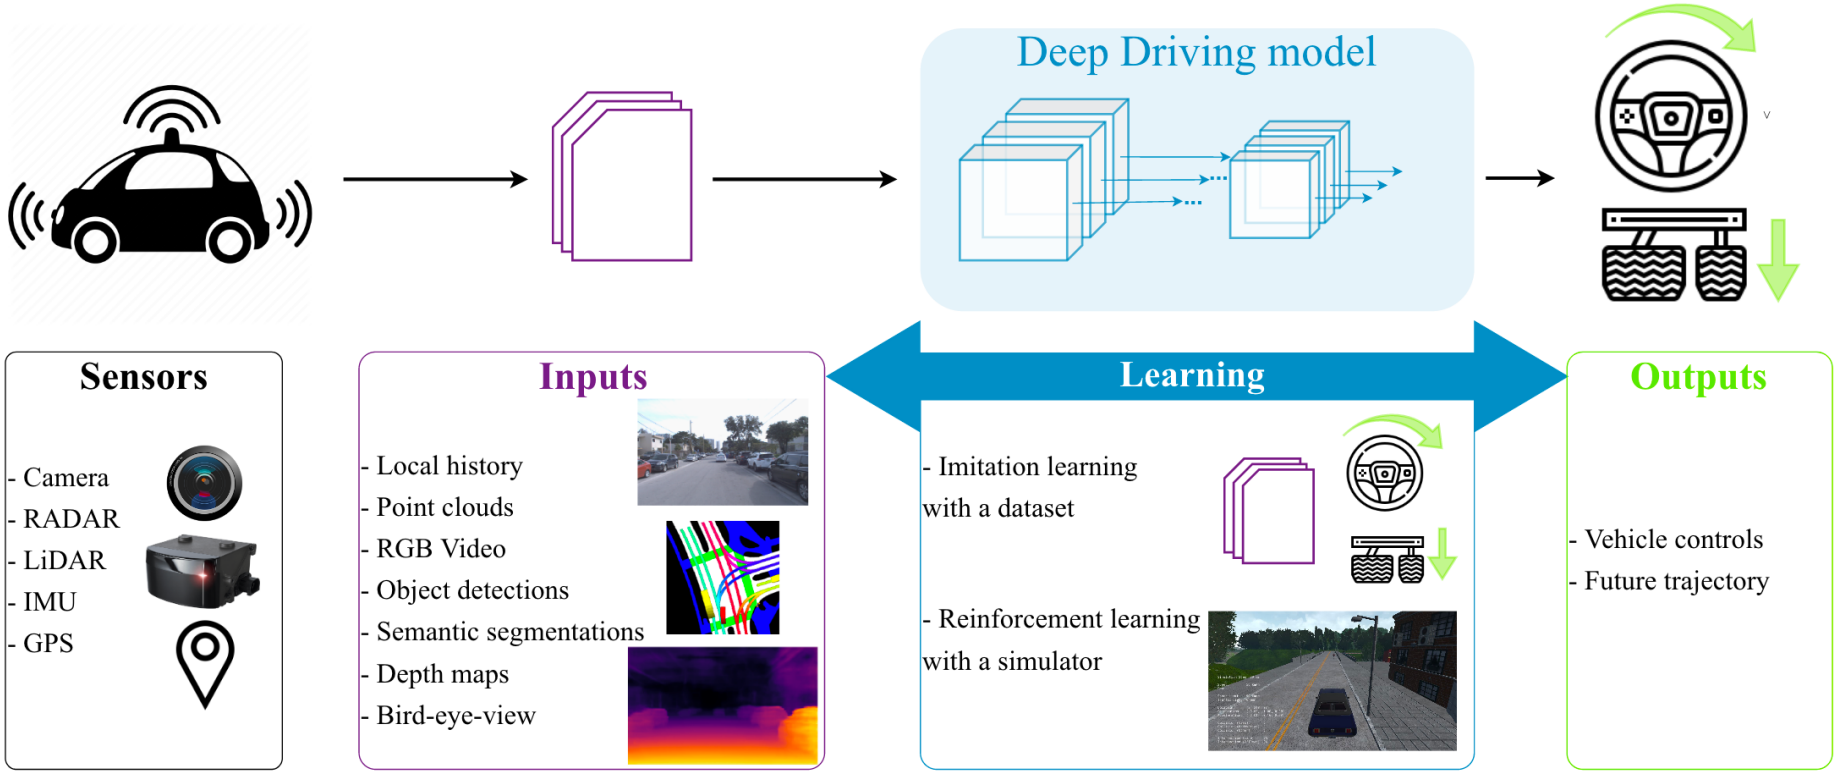
Domain adaptation

Other architecture: Image translation for Domain adaptation [Murez 2017]



Use-Case: Domain adaptation for Autonomous driving

Context: Neural network-based autonomous driving system framework



Challenges for perception

Multi-sensor perception

- Sensor fusion; Camera, radar and Lidar

3D dynamic understanding

- 3D object detection; Motion forecast; Intention prediction

Frugal learning

- Training with limited data or supervision; Domain adaptation

Reliability

- Robustness; Uncertainty estimation; Failure prediction

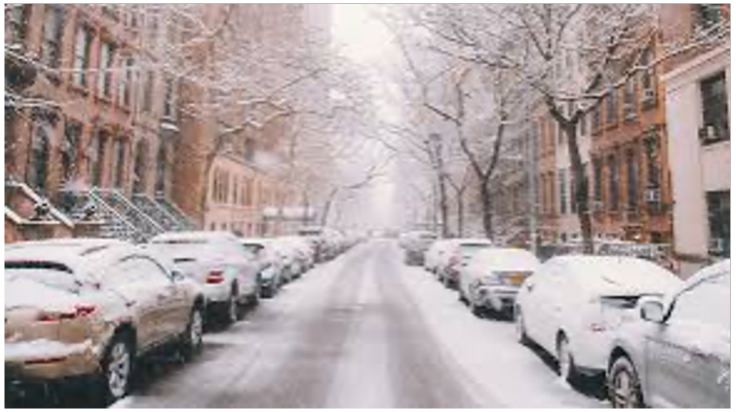
Explainability

- Decision interpretation; Post-hoc or by-design

Domain gap

Different, though *related* input data distributions

Source domain → Target domain



- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

Source domain → Target domain

- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

Source domain → Target domain

- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

Source domain → Target domain

- Different weather, light, location, sensor's spec/setup

Domain gap

Different, though *related* input data distributions

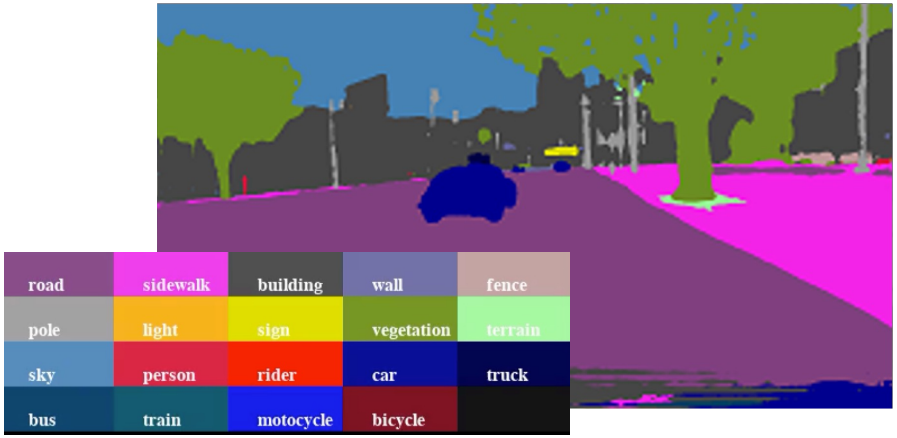
Source domain → Target domain

- Synthetic vs. real

Domain gap for VISUAL SEGMENTATION

Different, though *related* input data distributions

Source domain → Target domain

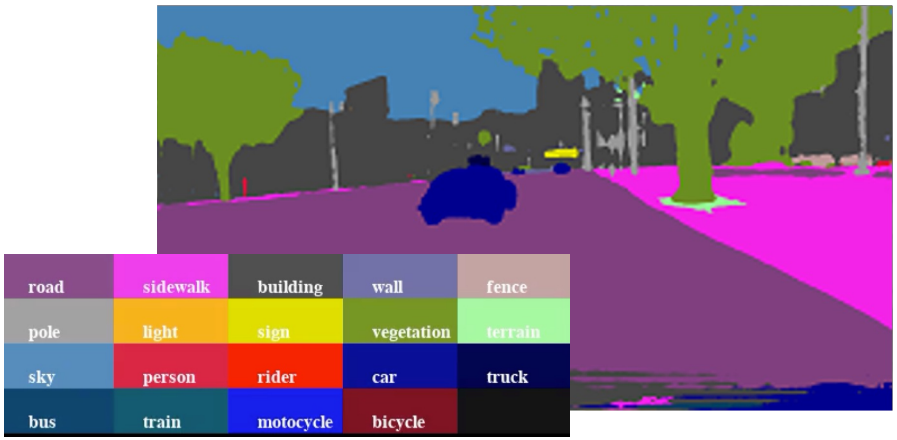


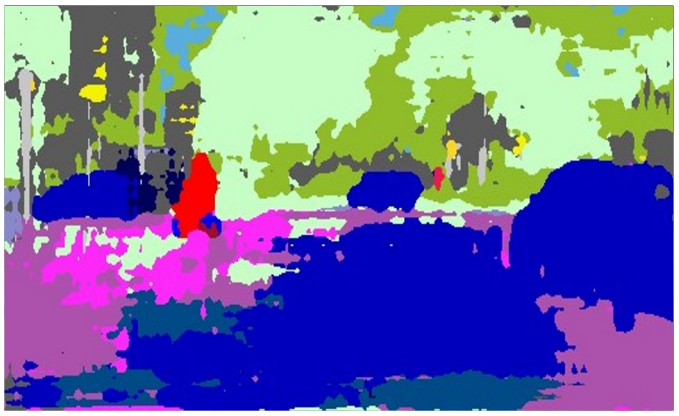
- Synthetic vs. real

Domain gap

Different, though *related* input data distributions

Source domain → Target domain





- Synthetic vs. real

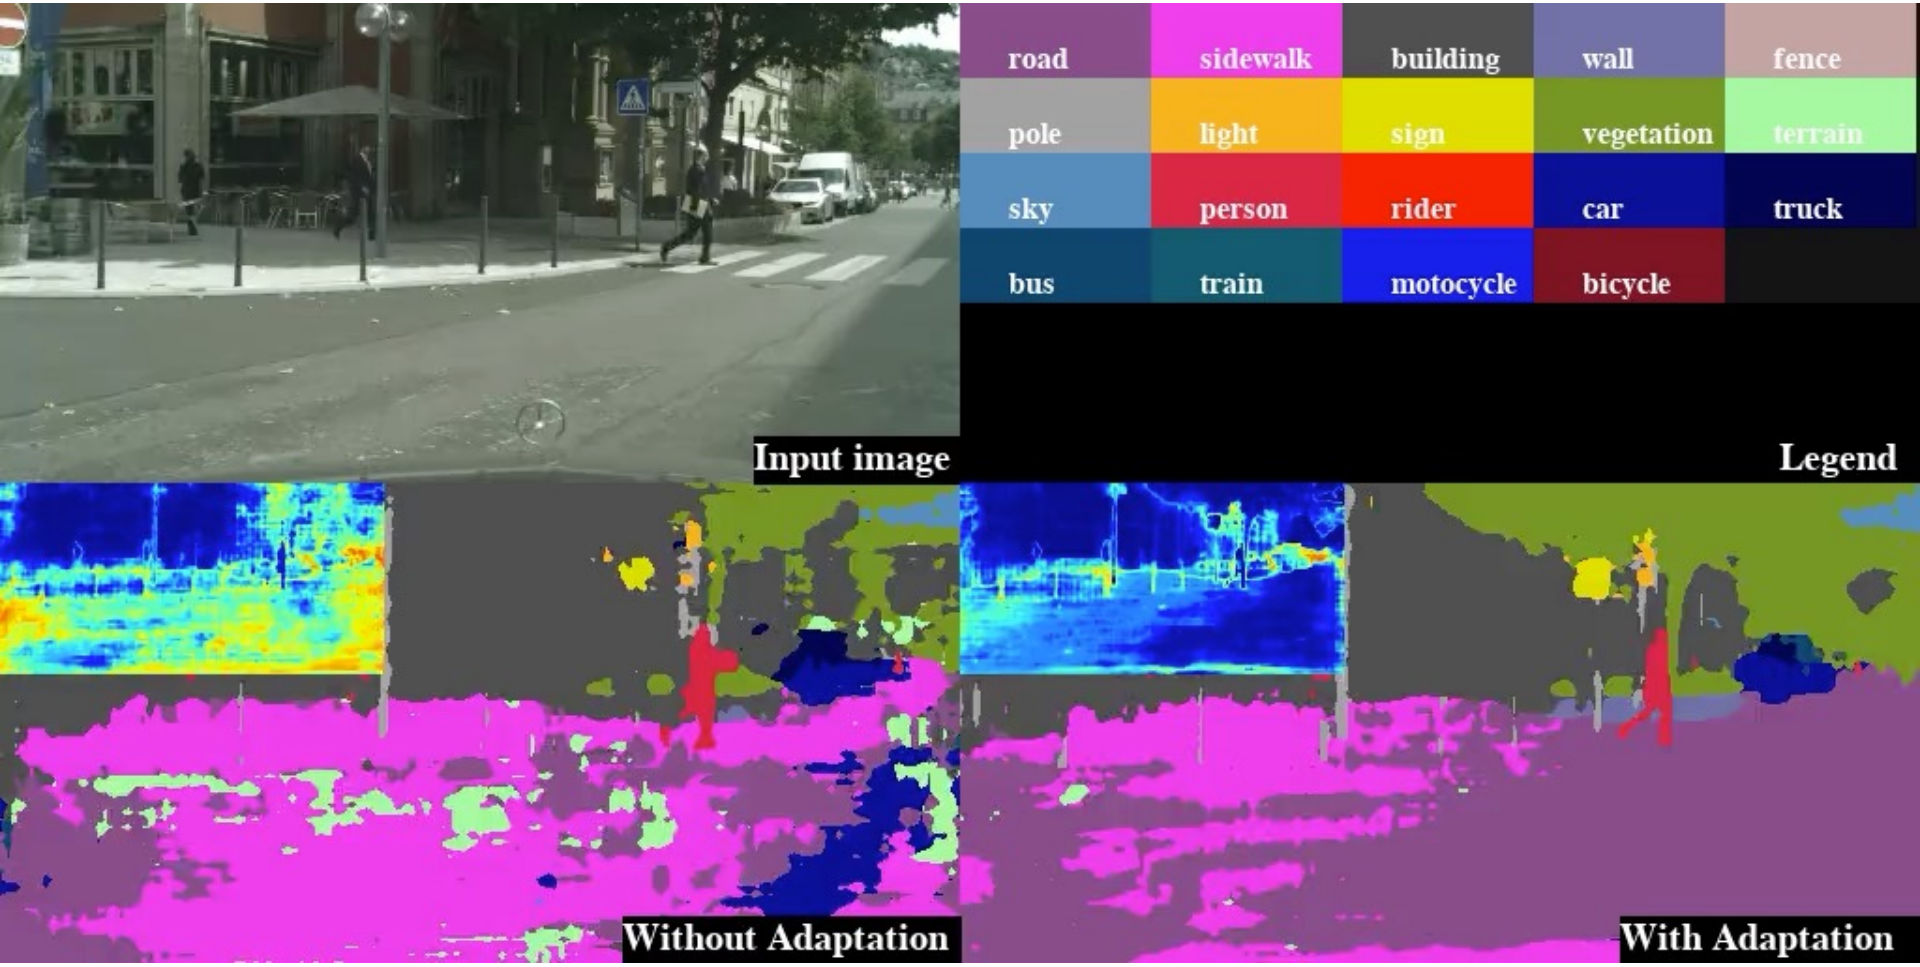
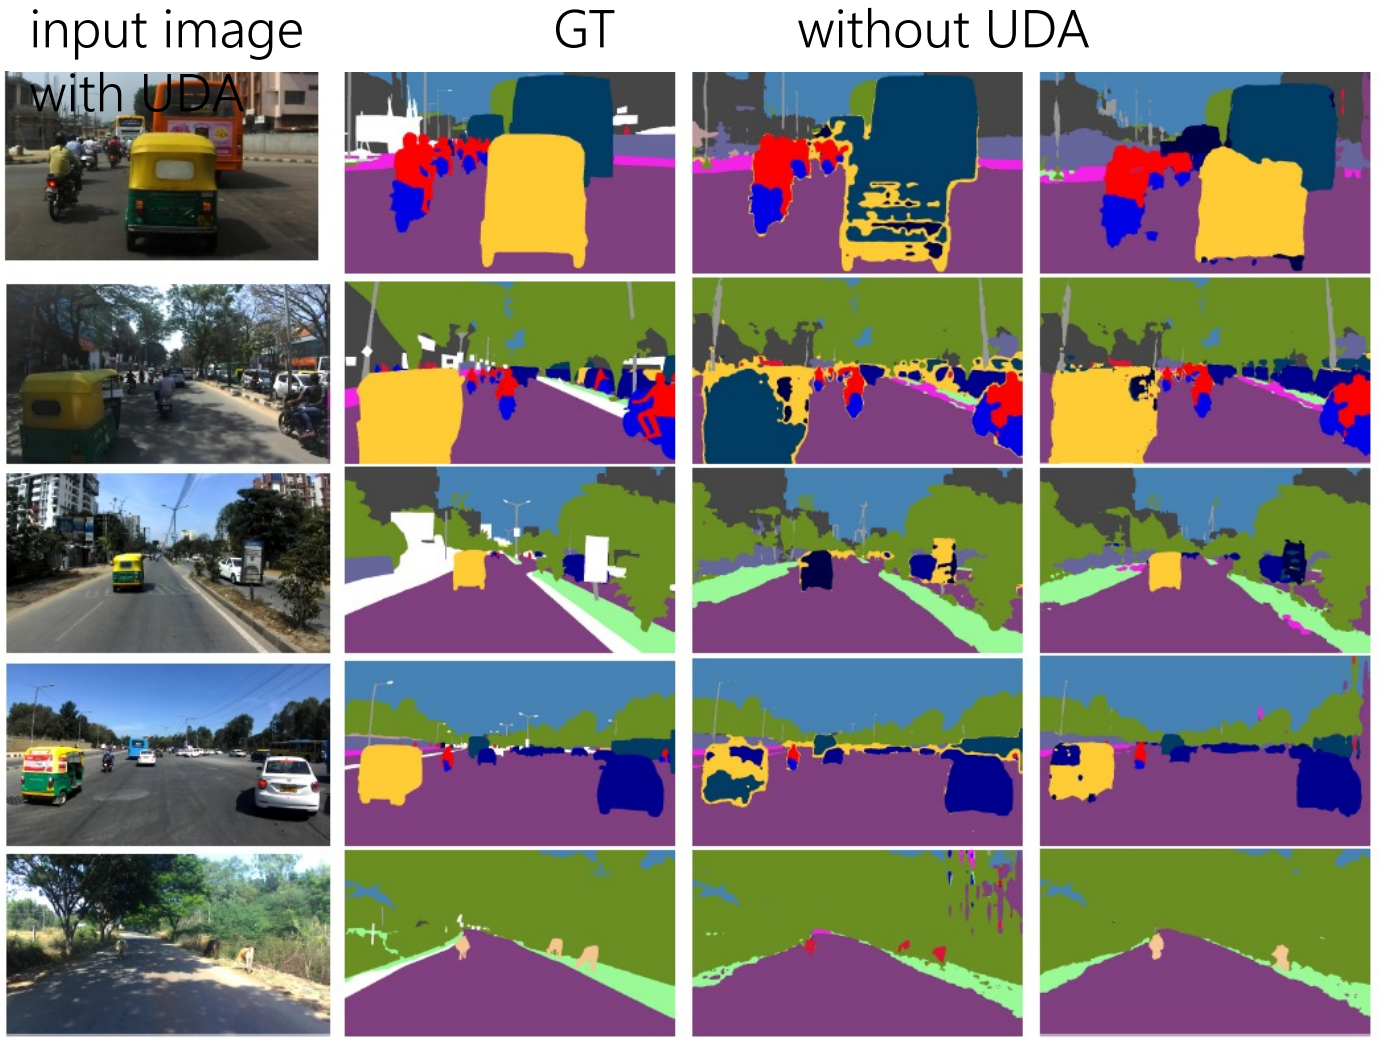
UDA Results (with Adversarial Entropy)

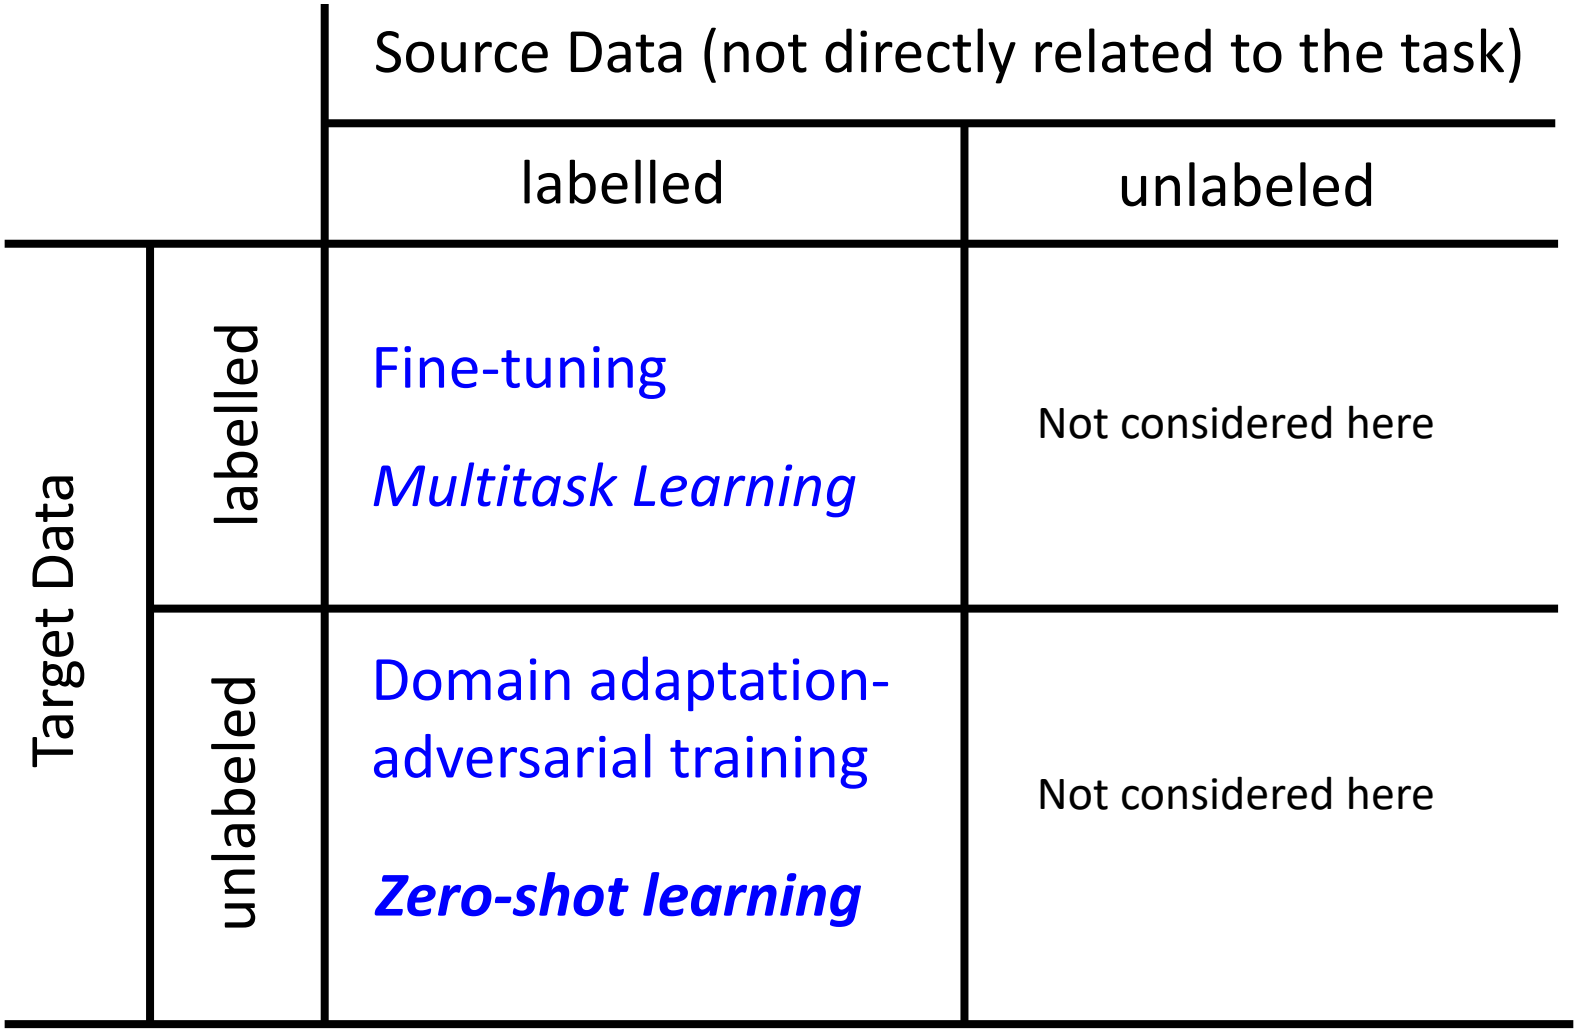


Extension: Zero shot + Domain adaptation



Private target classes: tuk-tuk, animal. Some shared classes: truck, road, side walk, car, person, motorbike, tree, building.

Transfer Learning - Overview



Zero-shot Learning

- Source data: (x^s, y^s) → Training data
- Target data: $(\emptyset)$ usually same domain

Different tasks

$Training\ time$:

x^s:   …

y^s: cat dog …

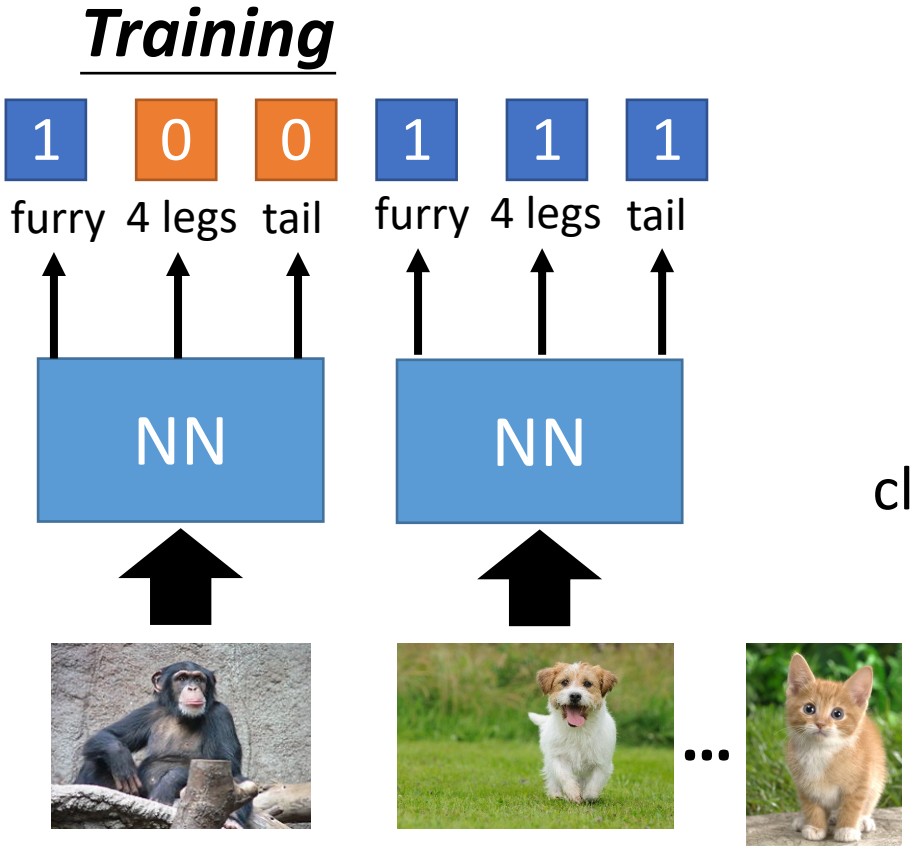
+ Class Information

$Test\ time\ x^t$: 

=> Fish class!

Zero-shot Learning

- Representing each class by its attributes



+
Database attributes

class

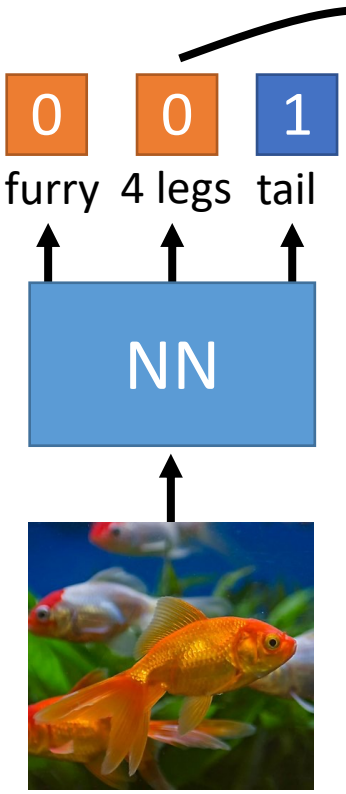
	furry	4 legs	tail	…
Dog	O	O	O	
Fish	X	X	O	
Chimp	O	X	X	
…				

sufficient attributes for one to one mapping

Zero-shot Learning

- Representing each class by its attributes

Testing



Find the class with the most similar attributes

class

attributes

	furry	4 legs	tail	…
Dog	O	O	O	
Fish	X	X	O	
Chimp	O	X	X	
…				

sufficient attributes for one to one mapping

Zero-shot Learning

What if we don't have attribute database

- Attribute embedding + class (word name) embedding

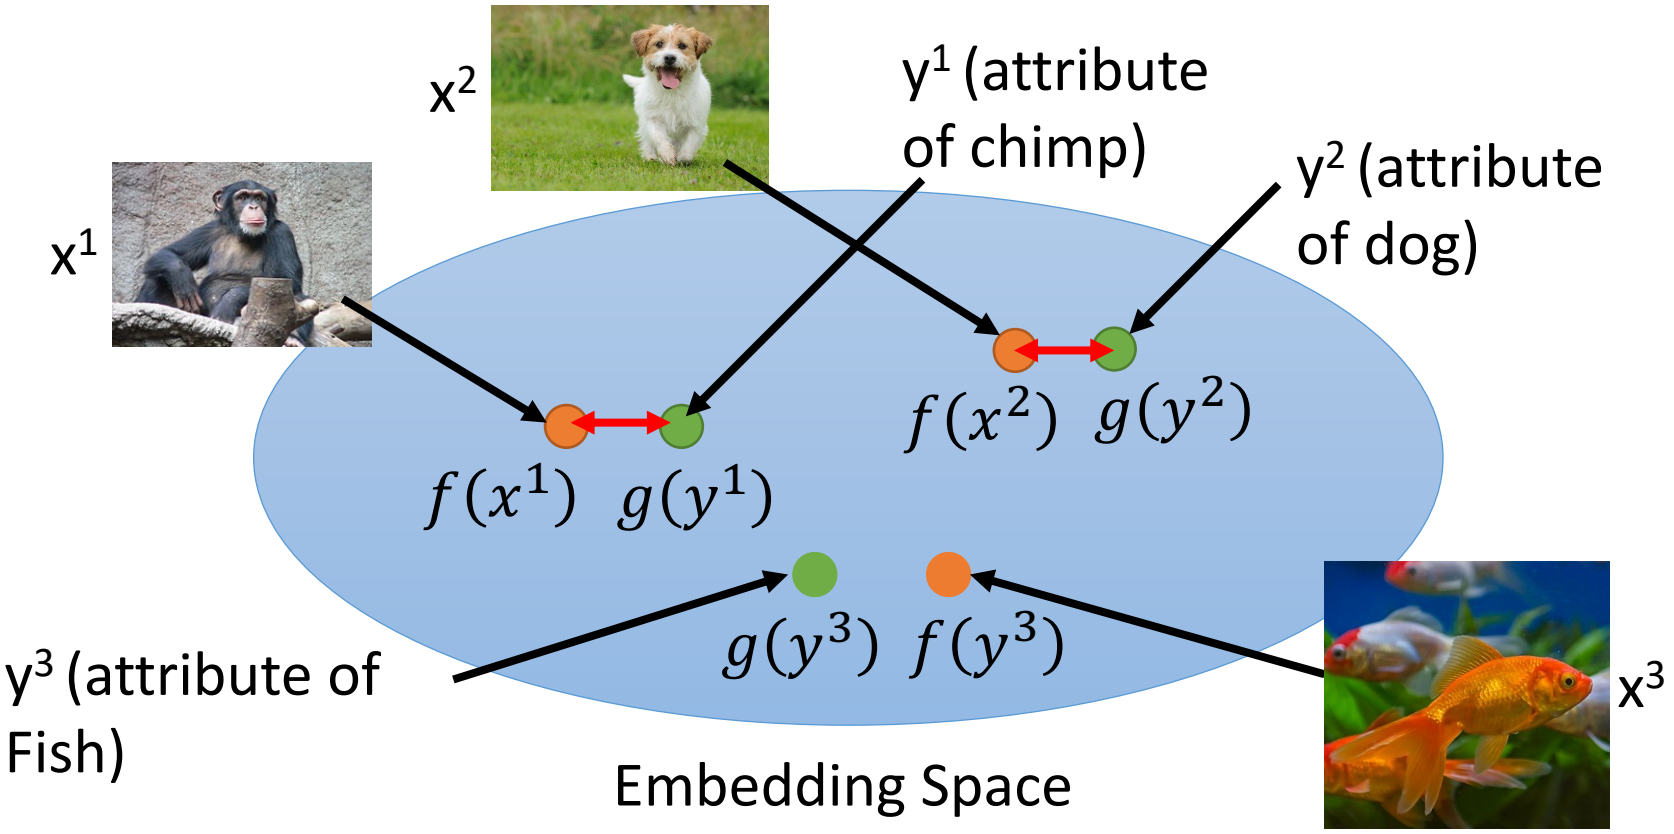
Zero-shot Learning

$f(*)$ and $g(*)$ can be NN.

Training target:

$f(x^n)$ and $g(y^n)$ as close as possible

- Attribute embedding



y^i are linked together by a class relationship (e.g. class name embedding as W2v)
